

AnsonDB integration module

The AnsonDB integration module allows sharing information about events and alarms between the Anson access control system and the Intellect PSIM for creating a unified integrated security platform powered by AxxonSoft software.

The AnsonDB integration module connects Anson access control system with ACFA Intellect for both monitoring and management. Hardware configuration is performed through Anson software.

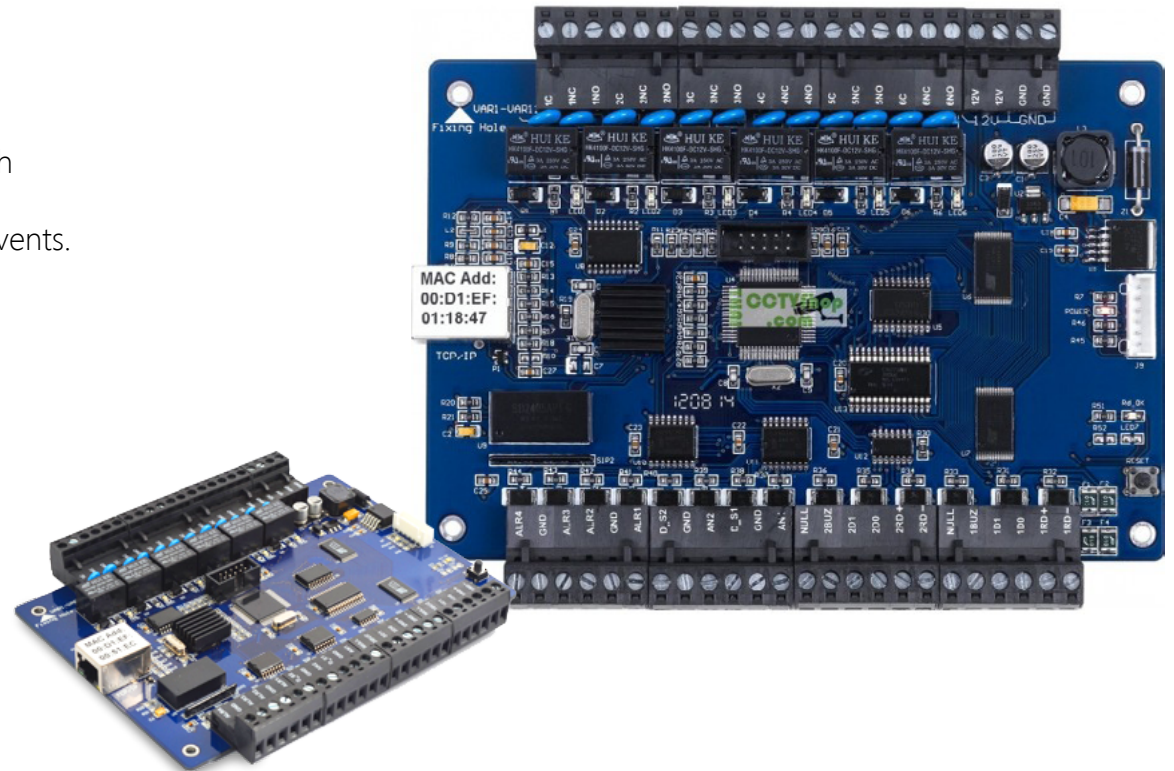

ME12 controllers can now be integrated with ACFA Intellect, with support for connecting up to two readers (Wiegand interface). Device memory is sufficient for storing 20,000 cards and 50,000 events.

Here are just some of functionalities integrated:

- System Message
- Legal card, illegal card, Illegal password
- Antipasback
- Open by exit button
- Door magnet alarm

These events may trigger a range of response scenarios:

- Remote open, Forced open
- Forced close, Release forced status
